

Appendix: Identification of circadian clock modulators from existing drugs

Table of Contents:

Appendix Figure S1. Dose-dependent effect of hit compounds.

Appendix Figure S2. Effect of endogenous steroid hormones on circadian period in U2OS cells.

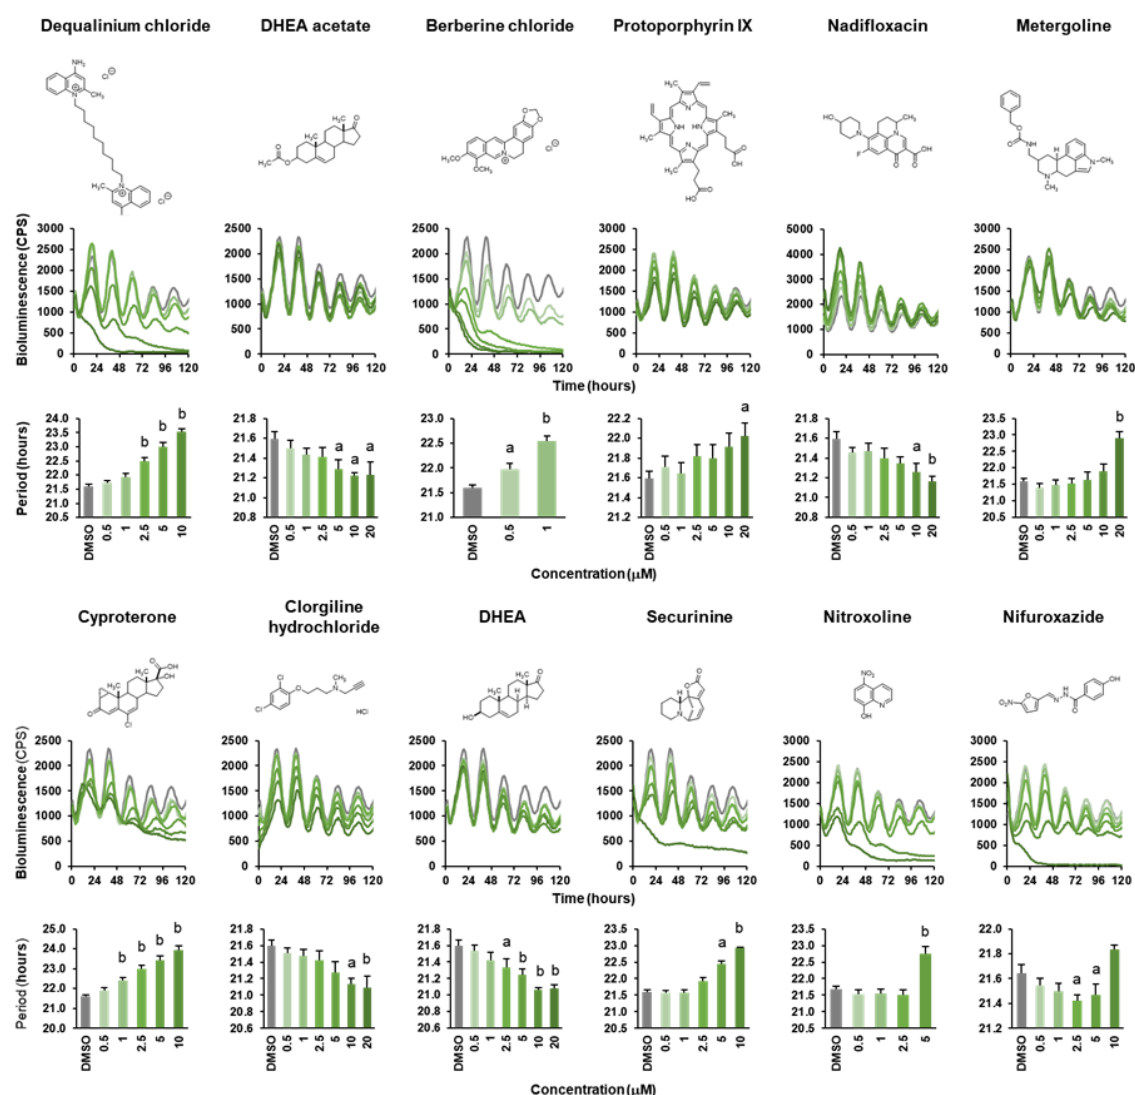

Appendix Figure S3. Effect of siRNA-mediated knockdown on mRNA levels.

Appendix Figure S4. No signal was observed in *in situ* negative controls.

Appendix Figure S5. Media components do not interfere with the effect of hit compounds DHEA, Dasatinib and Nilotinib.

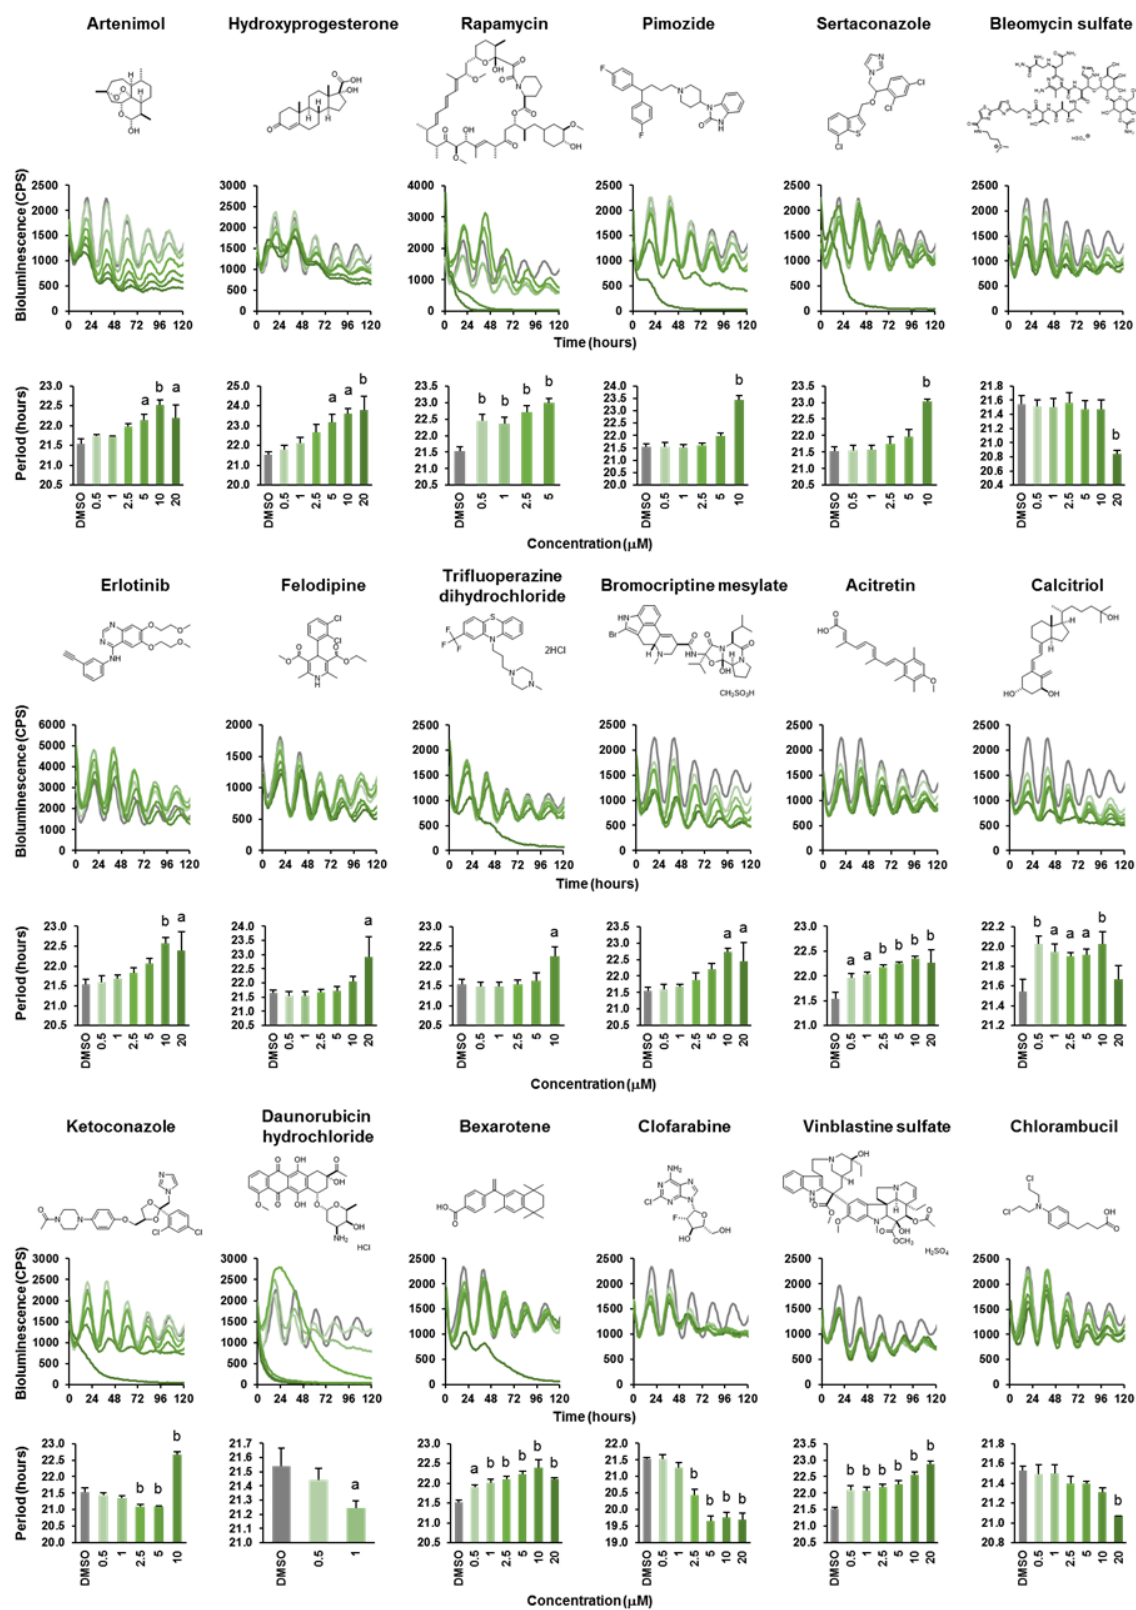

Appendix Table S1. Statistical information for main Figures.

Appendix Table S2. Statistical information for Expanded View and Appendix Figures.

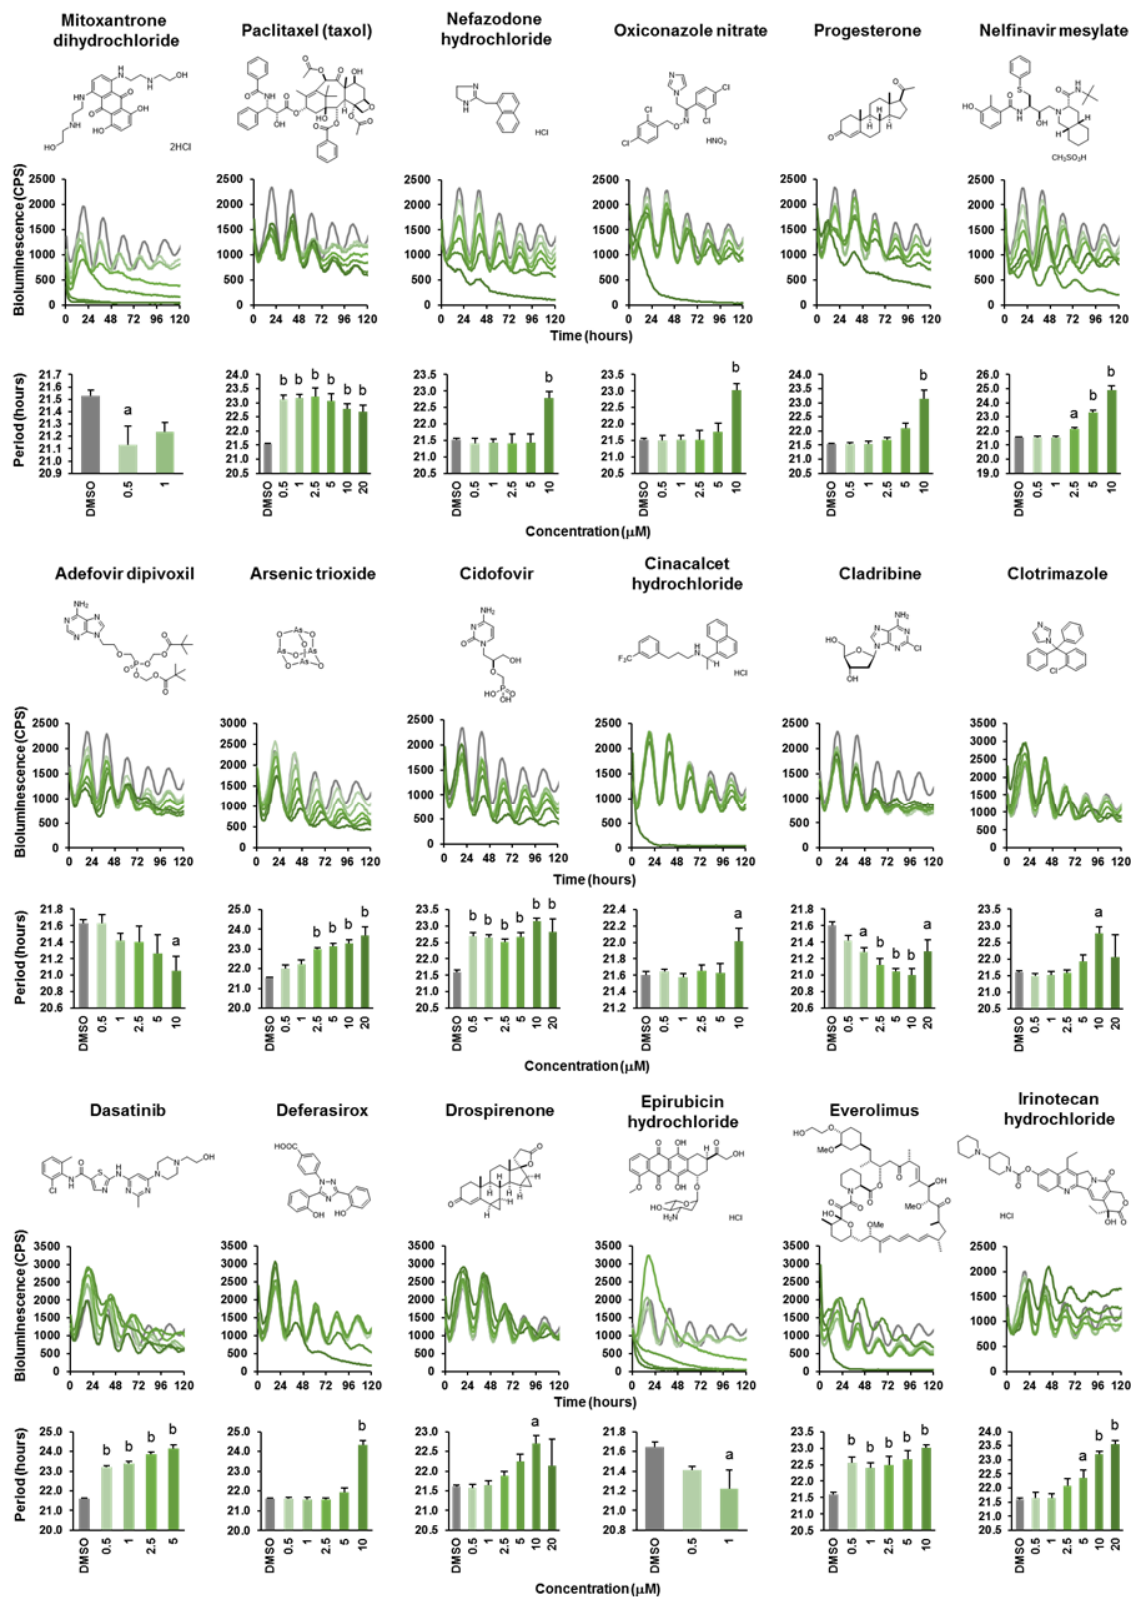

Appendix Figure S1. Dose-dependent effect of hit compounds.

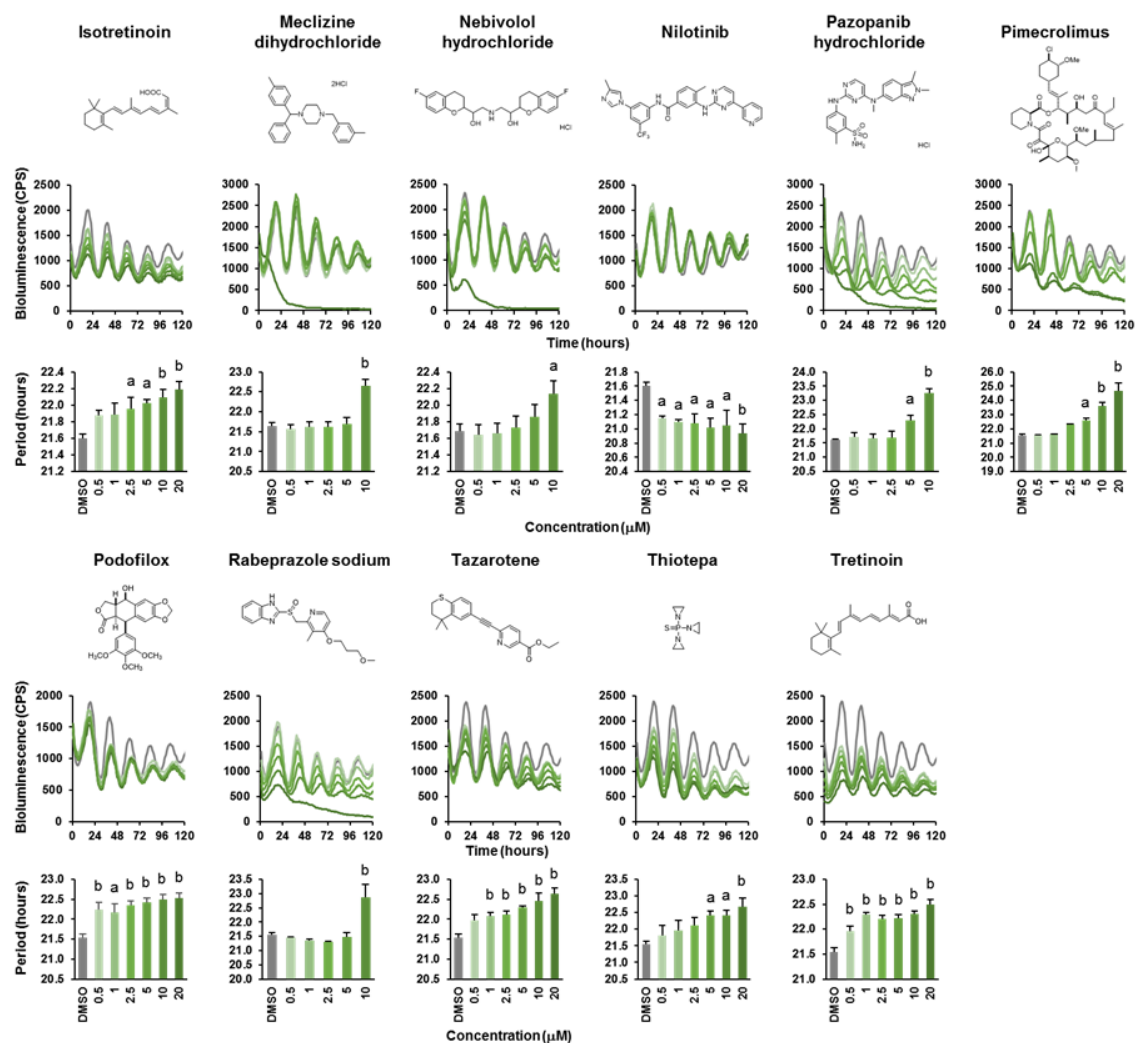

Secondary screening revealed that 59 of 72 potential hit compounds had significant dose-dependent effects on circadian period in U2OS cells. Chemical names and structures are shown for each hit compound above luminescent traces from one of 3 or 4 independent experiments. Histograms below show dose-dependent effects on circadian period, and results are presented as the mean \pm SEM of 3 or 4 experiments. Data were analyzed by one-way ANOVA, followed by a Dunnett's test (^a $p < 0.05$, ^b $p < 0.01$). All statistical information is shown in Appendix Table S2.

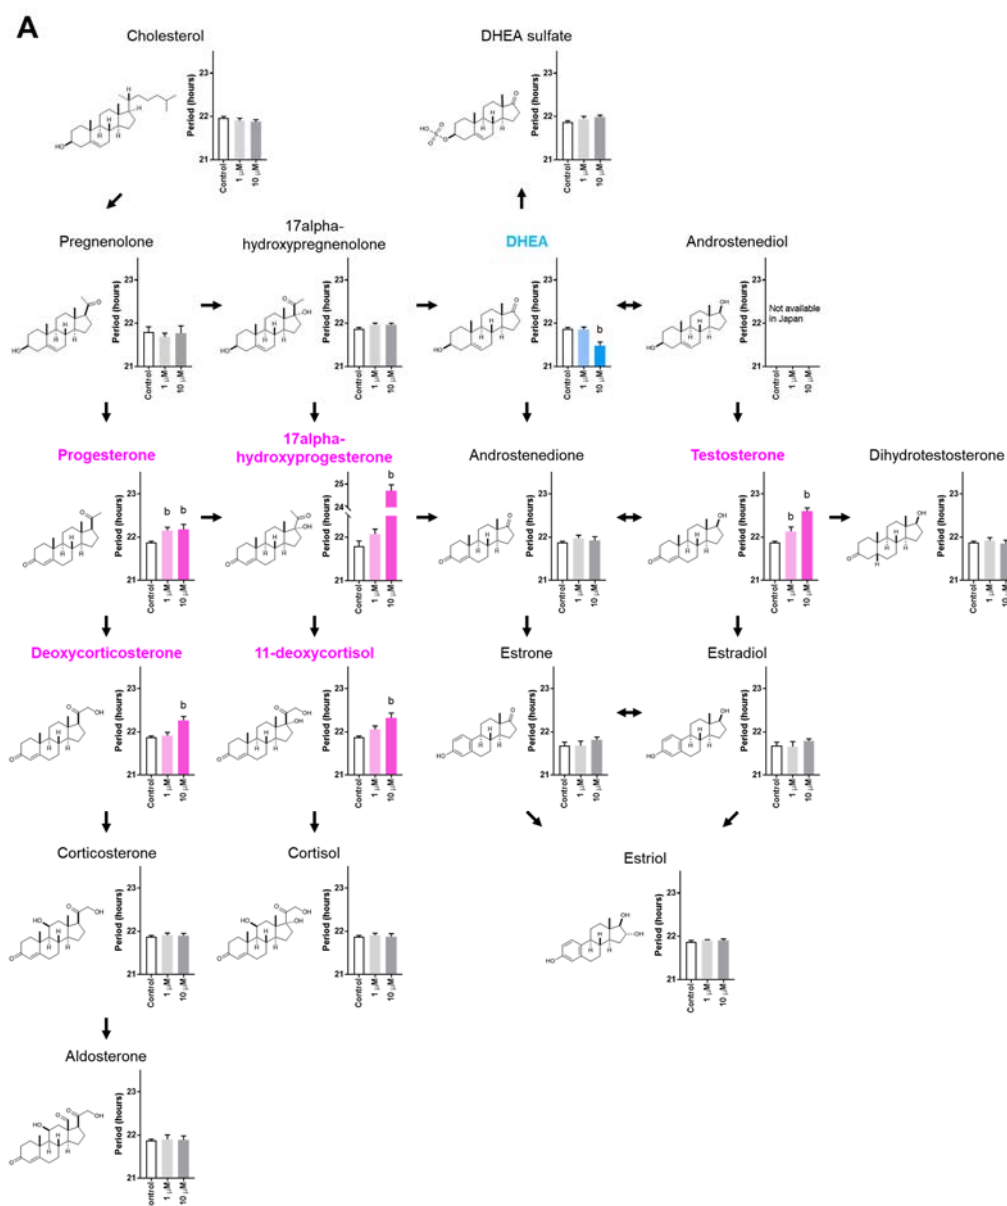

Appendix Figure S1. (continued)

Appendix Figure S1. (continued)

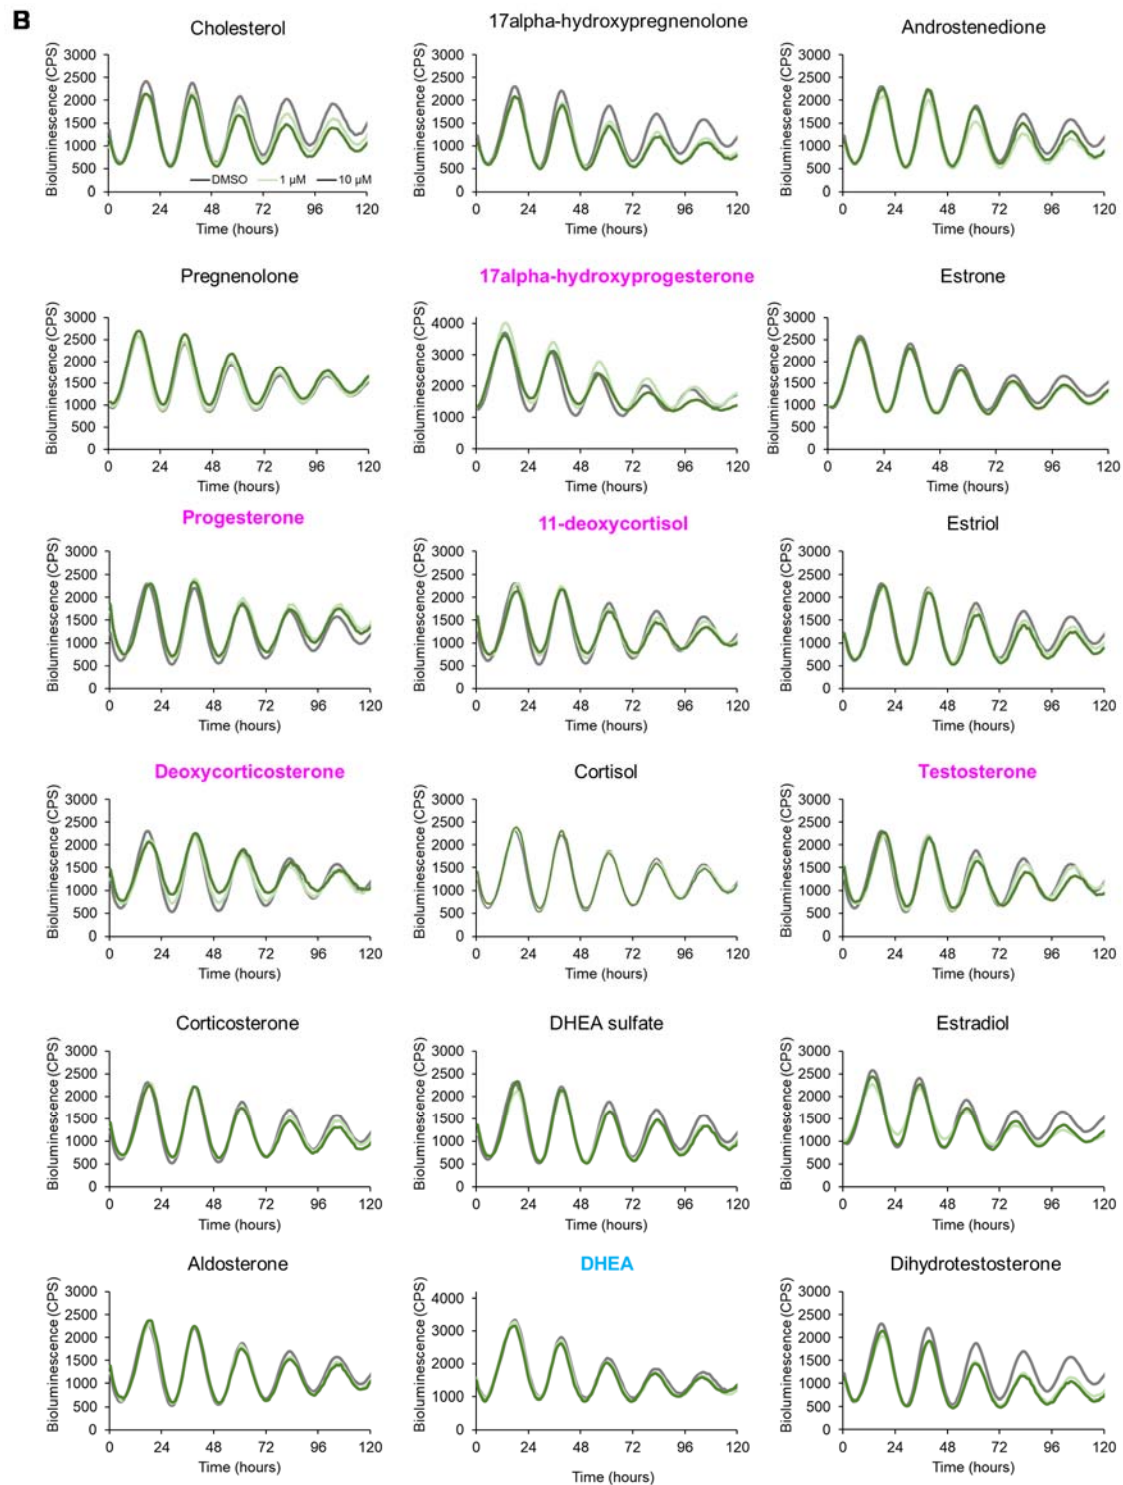

Appendix Figure S1. (continued)

Appendix Figure S2. Effect of endogenous steroid hormones on circadian period in U2OS cells.

A. Biosynthetic pathway and structure of endogenous steroid hormones tested are shown. Histograms show the effects of DMSO control (white bar) and steroids at 1 μ M (light color) and 10 μ M (darker color) on circadian period in U2OS cells. Compounds that lengthened period are highlighted in pink, and those that shortened circadian period are highlighted in blue. Results are presented as the mean \pm SEM. Data were analyzed by one-way ANOVA, followed by a Dunnett's test (^a $p < 0.05$, ^b $p < 0.01$). All statistical information is shown in Appendix Table S2.

Appendix Figure S2. (continued)

B. Luminescent traces from one experiment is shown and reveals dose-dependent effects of various endogenous steroid hormones tested.

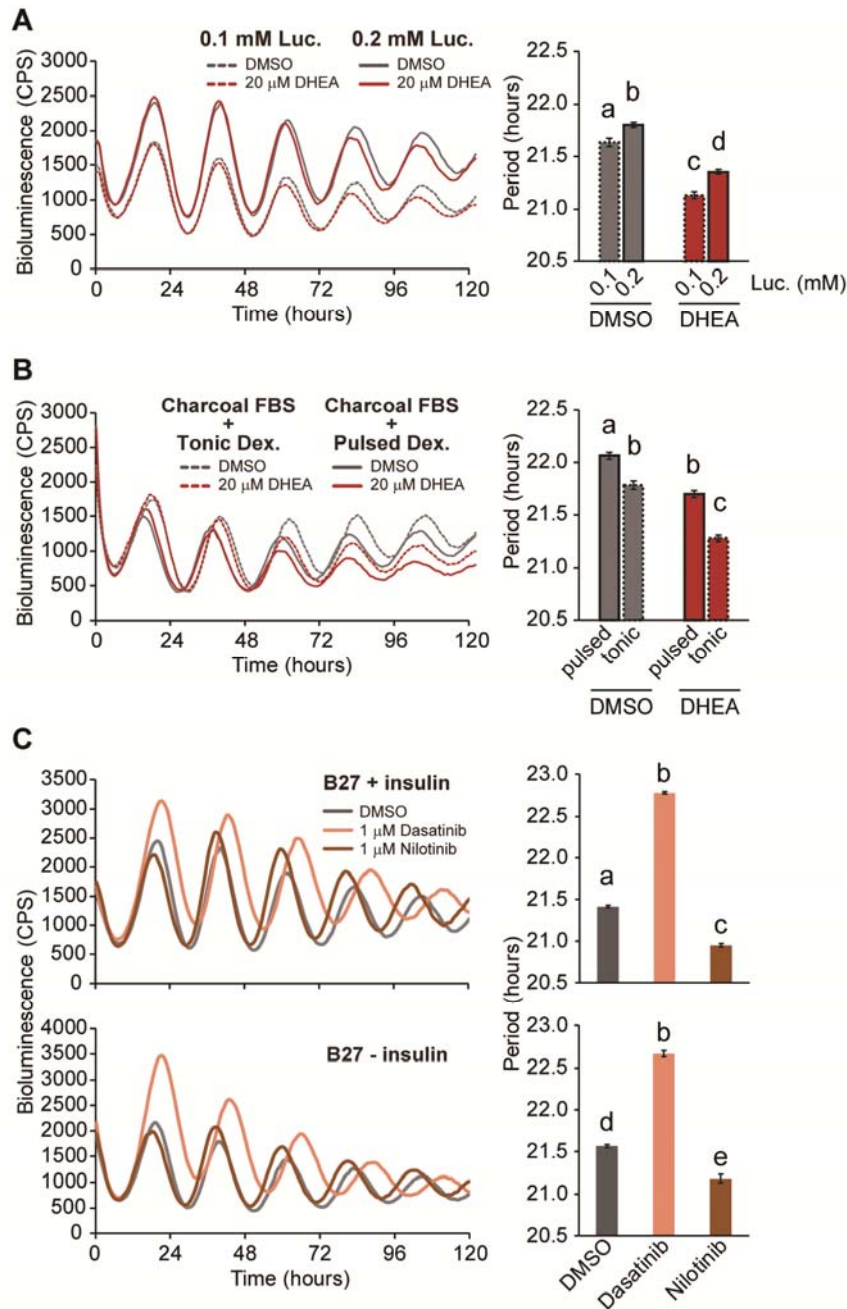

Appendix Figure S3. Effect of siRNA-mediated knockdown on mRNA levels.

mRNA levels were analyzed by qPCR and normalized to *GAPDH*. Data are presented as the mean \pm SEM of 3 or 4 independent experiments (** $p < 0.01$, Welch's t -test). All statistical information is shown in Appendix Table S2.

Appendix Figure S4. No signal was observed in *in situ* negative controls.

Representative autoradiograms. Negative control sections were hybridized in the presence of excess unlabelled probe.

Appendix Figure S5. Media components do not interfere with the effects of hit compounds DHEA, Dasatinib and Nilotinib.

A. DHEA shortens circadian period in the presence of different luciferin (Luc) concentrations in the media (0.1 mM versus 0.2 mM). Results are presented as the mean \pm SEM ($n = 6$). Data were analyzed by two-way ANOVA, followed by a Sidak's multiple comparisons test ($p < 0.01$). All statistical information is shown in Appendix Table S2.

B. DHEA shortens circadian period in the absence of corticosterone or other steroid hormones in the media. Results are presented as the mean \pm SEM ($n = 6$). Data were analyzed by two-way ANOVA, followed by a Sidak's multiple comparisons test ($p < 0.01$). All statistical information is shown in Appendix Table S2.

C. The presence or absence of insulin in the media supplement B27 did not influence the period-lengthening or -shortening effects of tyrosine kinase inhibitors, Dasatinib and Nilotinib, respectively. Results are presented as the mean \pm SEM ($n = 6$). Data were analyzed by two-way ANOVA, followed by a Sidak's multiple comparisons test ($p < 0.05$). All statistical information is shown in Appendix Table S2.
